# Stretch film innovation

■ The German producer of blown films presents the DDK-film claimed to be a pioneering innovation in the stretch film market. The unique feature of this film is the double edge, which makes it twice as strong and tear-resistant at the edges compared to conventional films. A 15 micron film for example has at the edges a thickness of 30 microns. This is said to pre-

vent film breaks that begin at the edges in more than 90% of all cases.

In addition to that, the net structure that is generated through the wrapping process considerably increases the pallet stability. The double edge realises a smaller necking and a better overlapping of the film layers. Thanks to this the usually critical pallet bottom and packaged goods are connected optimally.

Duo Plast's new stretch film has already won the "German Packaging Award" and the 'PIF Gold Medal' and signals a new trend in the field of load security.
